Chapter 17: Temporal Network Analysis

1. Introduction

Temporal networks track how relationships evolve over time. Week-by-week analysis reveals network dynamics, including growth phases and stabilization.

2. Methods

Time-sliced networks computed for weeks 1-8. Network density, size, and node degree centrality tracked over time.

3. Results

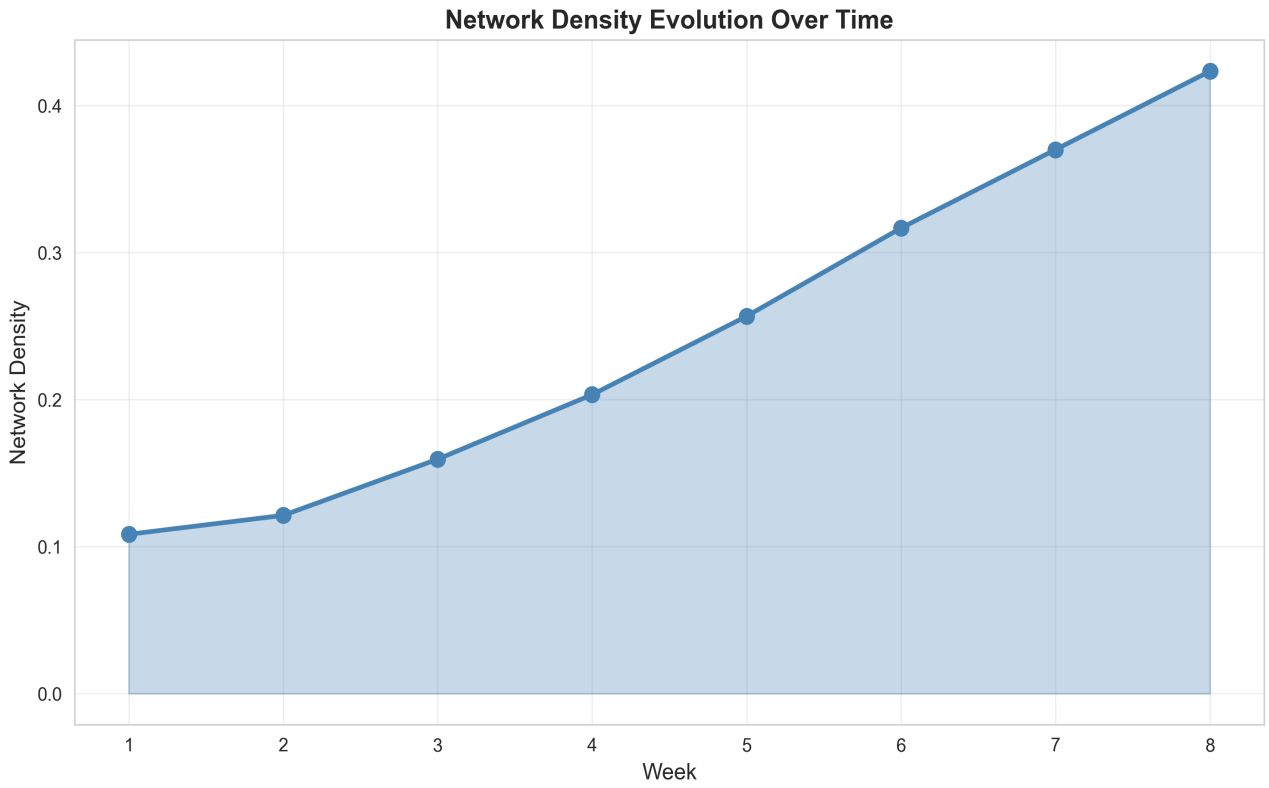

Fig 1: Network density trajectory.

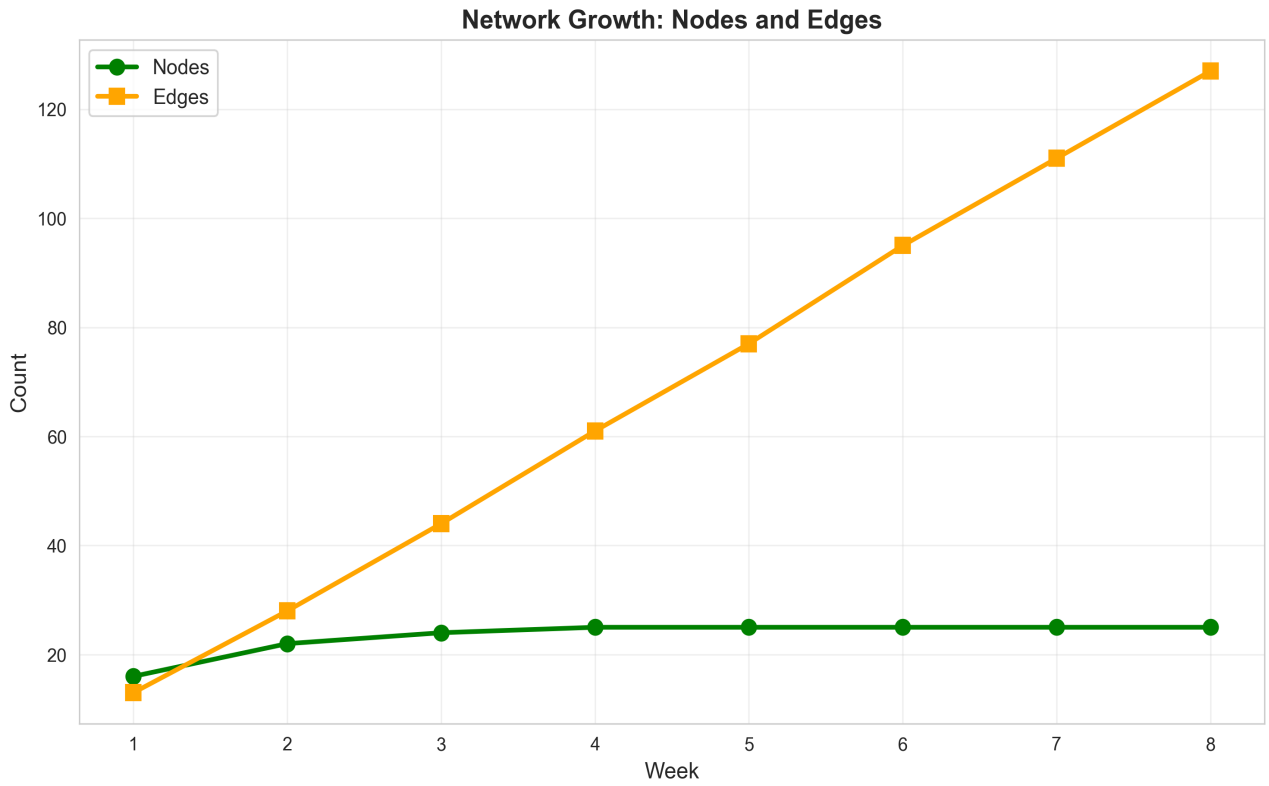

Fig 2: Network size growth.

4. Interpretation

Network density increase indicates growing interaction. Individual degree trajectories reveal participation patterns—accelerating or declining engagement.
