Chapter 16: Community Detection

1. Introduction

Community detection identifies cohesive groups within networks. In course networks, communities represent student study groups or collaboration clusters.

2. Methods

Greedy modularity optimization algorithm used. Modularity score: 0.6606. Identified 3 communities.

3. Results

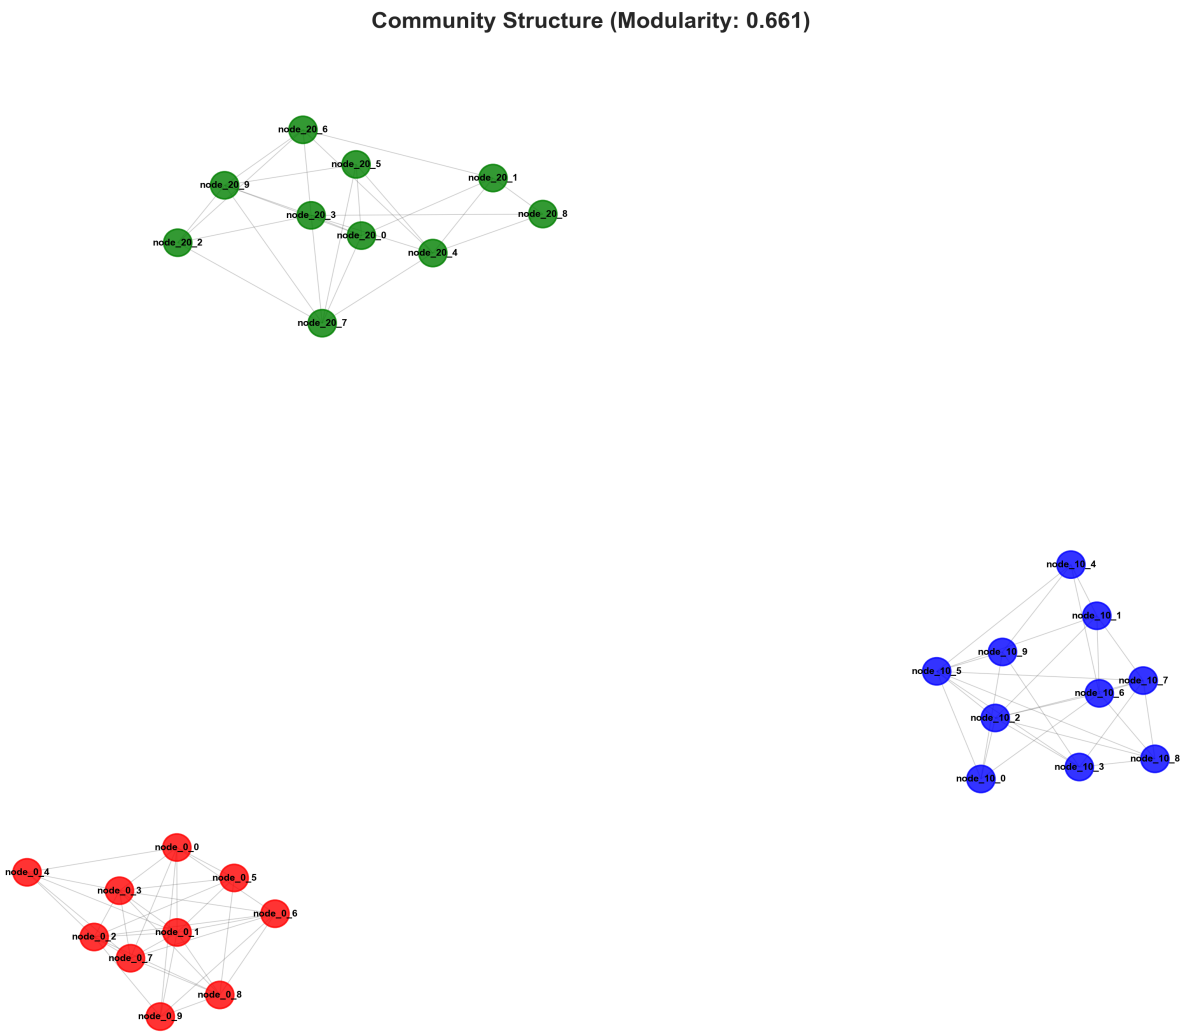

Fig 1: Network with detected communities.

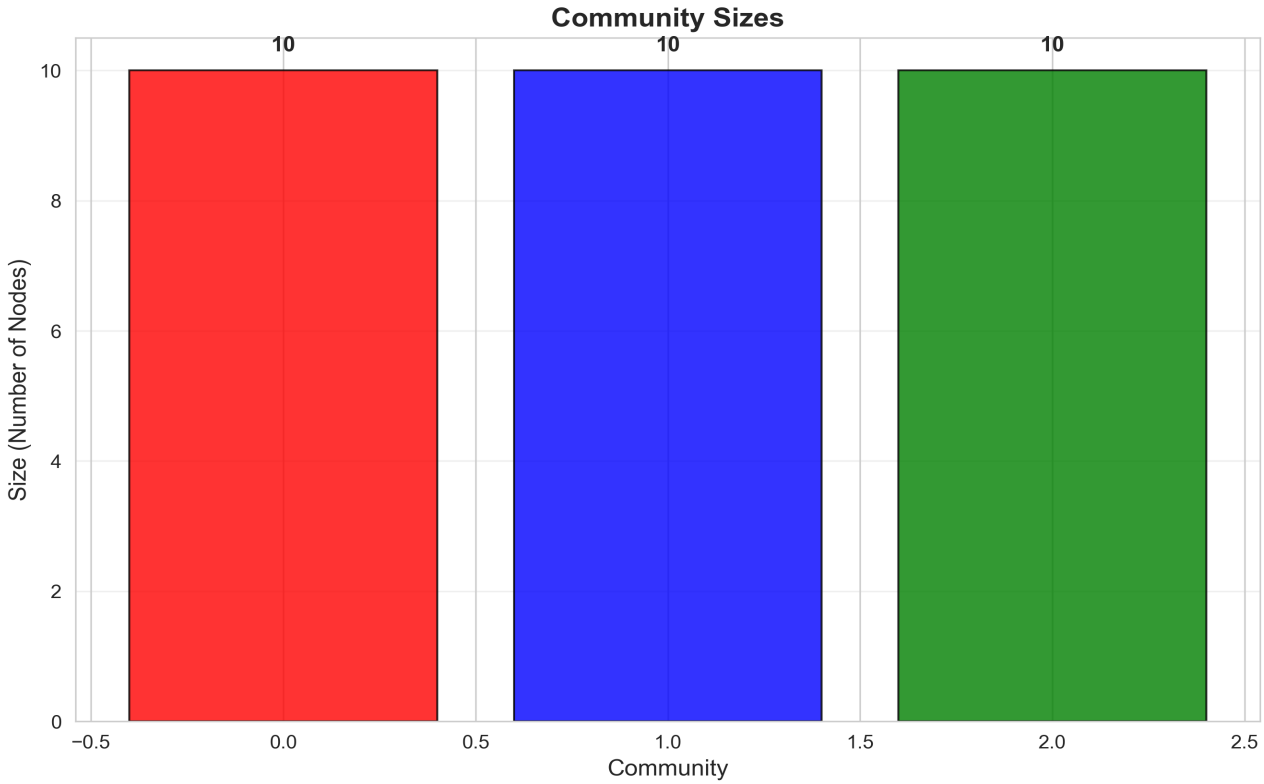

Fig 2: Community size distribution.

4. Interpretation

High modularity indicates clear community structure. Communities can inform intervention strategies targeting student groups.
