Chapter 14: Process Mining

1. Introduction

Process mining discovers workflows by analyzing event logs. Directly-follows graphs reveal which activities typically follow one another, enabling identification of standard learning processes and deviations.

2. Methods

Event logs were analyzed to extract activity sequences per case. Directly-follows graph constructed by counting transitions. Paths ranked by frequency. Network visualization applied.

3. Results

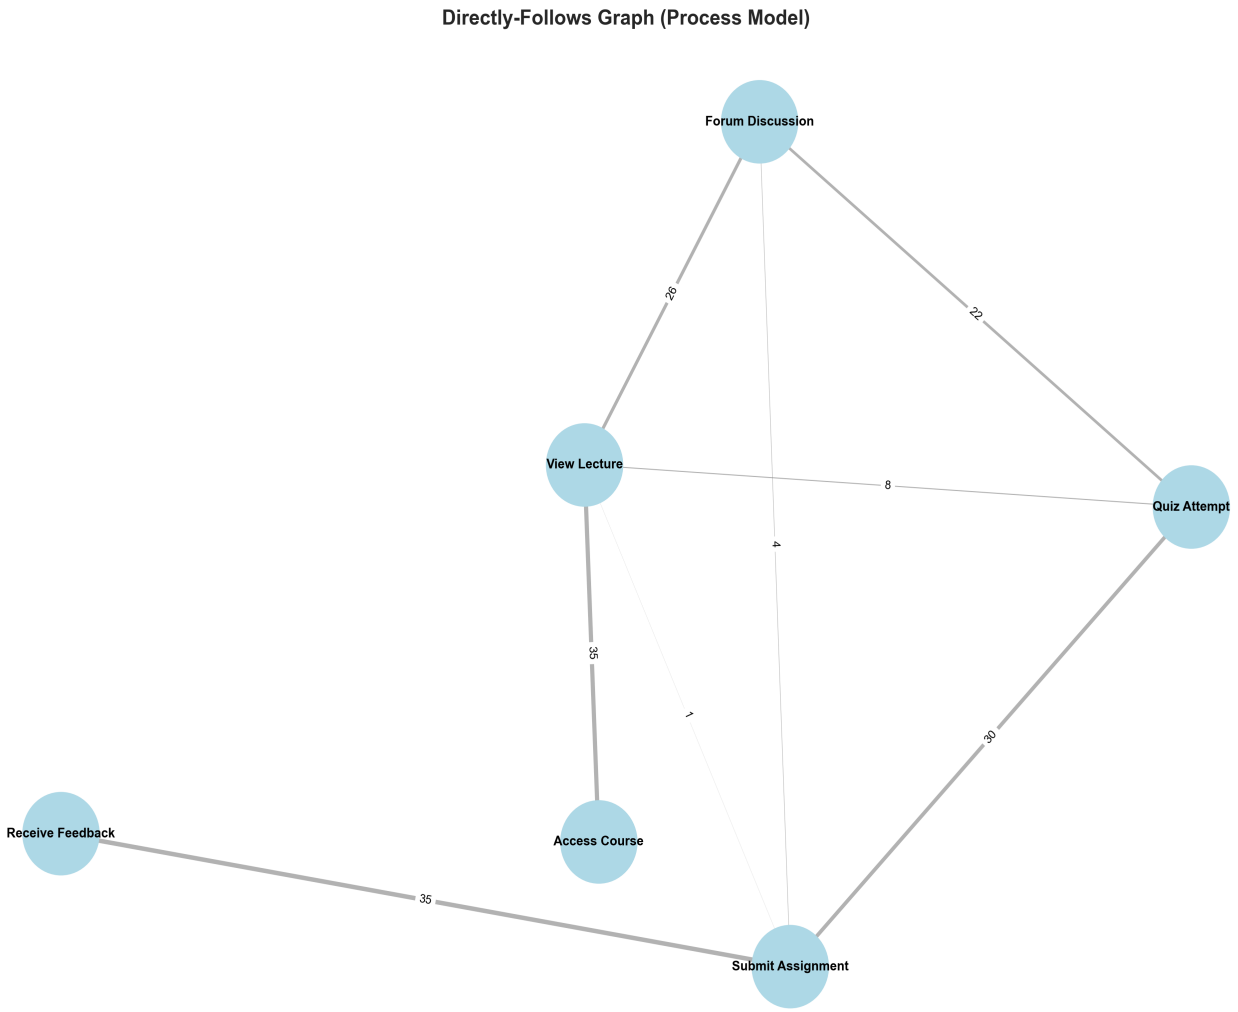

Fig 1: Directly-follows graph showing activity transitions.

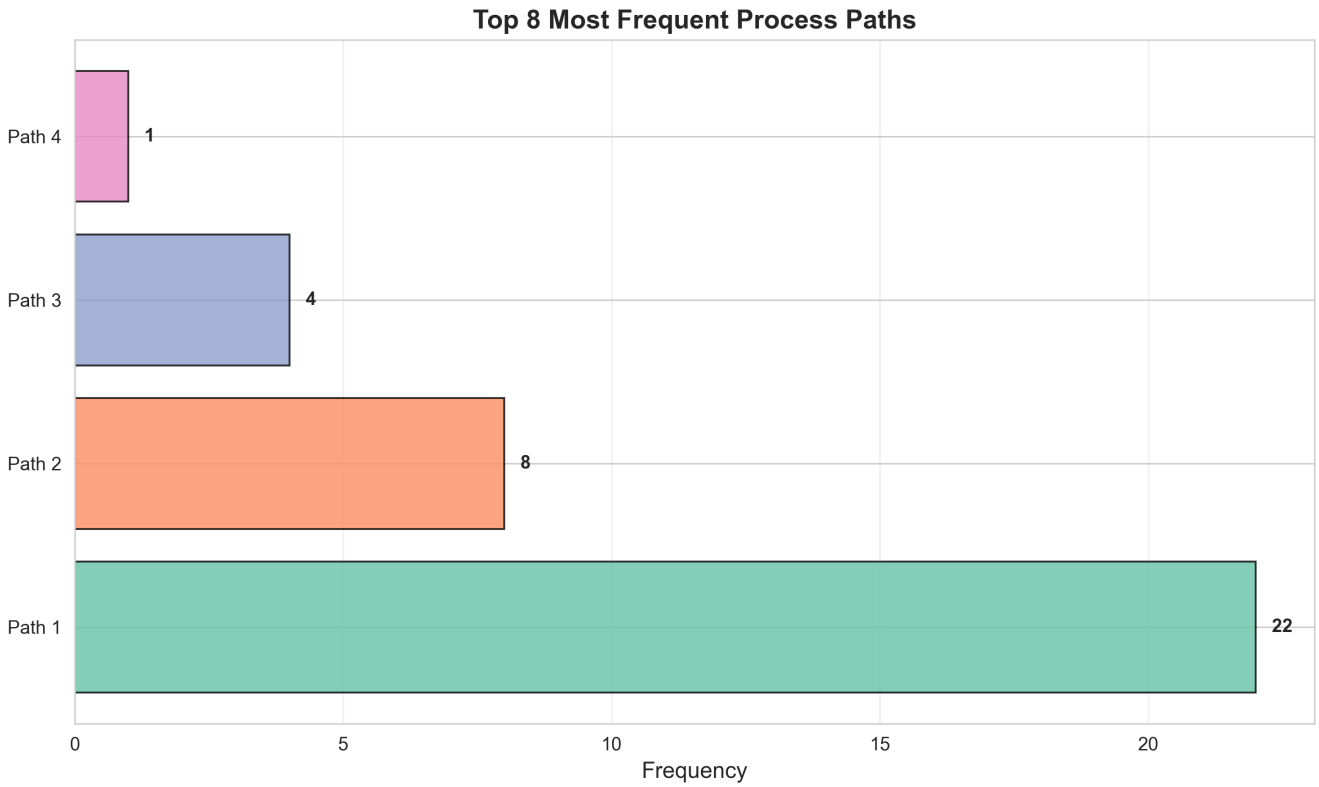

Fig 2: Frequency of top learning paths.

4. Interpretation

The process model reveals standardized learning workflows. Frequent paths indicate best practices; rare paths suggest alternative strategies. Bottlenecks appear as activities with high in-degree and low out-degree flow.
